

String Theory

Modern science seems complex
I've tried to understand
I've read up on the internet
But the essays were so bland

I know I learnt at school
About molecules and stuff
I thought I had a grasp of it
But now I've had enough

It seems that we are not
As previously thought
Just made up of atoms
The way that we were taught

There is something smaller still
And it's not a solid shape
It's teeny weeny bits of string
That always move and shake

The essays say that this is great
It's physics unified
But when I tried to understand
Well, I almost cried

Ten dimensions they now say
What would that really mean
Length and height and width
Are the only ones I've seen

I know that Einstein told us
That there are really four
Well, time I understand
But I can't find anymore

Oh and here's the kicker
This thinking may be right
But nobody can prove it
No matter just how bright

So unifying theory
You may be the real thing
But it seems there is no answer
How long's a piece if string?
